Fuel Delivery Systems

Electronic fuel injection (EFI) provides improved drive-ability, efficiency and performance. Today's high performance EFI engines require the utmost in fuel delivery systems. Constant fuel flow to the injectors must be guaranteed, regardless of how choppy the water can get or how tight the turn. Therefore, the marine engineer is challenged to find a way to ensure fuel flow without the need for a specially designed fuel tank or other apparatus.

According to the boating application, Crusader answers this challenge with exclusive, patented fuel delivery systems: the Crusader Fuel Control Cell or Crusader Aqua Cool.

Both systems ensure proper fuel filtration and fuel delivery to the injectors, regardless of the conditions.
