No-Vibe Mounts

Crusader's No-Vibe mounting system offers the highest degree of adjust-ability in the industry. Larger, more robust and extremely heavy-duty, Crusader's mounts ensure continuing perfect shaft alignment for years.

Sooner or later, however, the engine will have to be realigned as part of routine maintenance. The adjustable components of Crusader's mounts are easy to realign because they are made of non-corrosive state-of-the-art composite materials, rather than plated steel which is subject to rust and galvanic corrosion.

The mounting system must be able to dampen and absorb vibration to keep it from being transferred to the hull through the stringer system. Crusader uses large rubber isolators to better isolate the vibration.

Crusader's superior mounting system extends to the overall design, which positions the mounts close-in to the transmission at the mid-point, evenly distributing the weight for a stronger, more rigid hold. This position prevents movement, which would destroy the perfect alignment and vibration-free ride.
